Lunar Router — Content Calendar V2 (20 Days)

Hooks fortes. Resultado primeiro. Produto depois.

PRE-LAUNCH (7 dias antes do Day 1)

Semana de preparação

Stars iniciais (meta: 200 antes do lançamento):

- DM pra 50-100 devs (amigos, comunidades Discord, Telegram groups de AI/LLM)
- Pedir star individualmente com mensagem pessoal, não spam
- Postar em Discord servers de AI/LLM com demo rápida
- Repo com 0 stars não converte. Com 200, estranhos começam a dar star.

README do GitHub:

- GIF demo no topo (git clone → make start-full → dashboard abrindo)
- One-liner: "Cut your LLM API costs by 60-80%. Track every token. Prepare training data automatically."
- Quick start em 3 comandos
- CTA visível: "⭐ Star this repo if it saved you money"
- Screenshots do dashboard (traces, cost breakdown, clustering)

Contas prontas:

- X account criada, bio configurada, 2-3 tweets "building in public"
- Reddit account com karma mínimo (se não tiver, passar 5-7 dias comentando genuinamente em r/LocalLLaMA, r/selfhosted)

DAY 1 — BLITZ LAUNCH (tudo em 48h)

O objetivo é disparar o algoritmo de Trending do GitHub. Velocidade de stars em 48h é tudo.

Hora 0 — Reddit r/LocalLLaMA

Title: I cut my LLM API bill from $420/mo to $73 by routing each prompt to the cheapest model that could handle it

Body:

```
I was mass paying OpenAI $420/month. No visibility into
what was going on. Every call hitting GPT-4o whether it
needed to or not.

Then I put a gateway between my app and the API. One line
change — base_url from api.openai.com to localhost:8080.

After one week of tracking every call, I found out:

- 38% were simple extraction/formatting. DeepSeek handles
  these identically at $0.14/M tokens instead of $2.50/M.
- 24% were classification. Groq's Llama 3.3 does them at
  near-zero cost, 10x faster.
- Only 38% actually needed GPT-4o.
```

```
Set up routing rules. Same app. Same output quality.
Bill went from $420 to $73.

The whole thing is 3 commands:

git clone https://github.com/lunar-org-ai/lunar-router
cd lunar-router
make start-full

Gateway on :8080 (Go, fast). Dashboard on :3000 (React).
ClickHouse handles trace storage. All in one docker compose.

Every call logged: model, tokens, cost, latency, full
input/output. Searchable. Filterable.

13 providers: OpenAI, Anthropic, Gemini, Mistral, Groq,
DeepSeek, Perplexity, Cerebras, SambaNova, Together,
Fireworks, Cohere, AWS Bedrock.

The part I didn't expect: it auto-clusters your prompts
by semantic similarity. After 10k calls I had 5 clean
datasets grouped by use case — ready for fine-tuning.
Didn't lift a finger.

MIT licensed. Self-hosted. Your data stays on your machine.

GitHub: [link]

AMA.
```

CRITICAL: Reply to EVERY comment for the first 3 hours.

Hora 1 — Hacker News

Title: Show HN: I cut my LLM costs 67% by auto-routing prompts to the cheapest model that delivers (open-source)

Body:

```
I was spending $420/mo on LLM APIs with zero visibility
into what each feature cost.

Built Lunar Router — an open-source gateway (Go + Python)
that sits between your app and 13 LLM providers.
OpenAI-compatible API, one-line migration.

What it does:
- Tracks every call: cost, tokens, latency, full I/O
- Dashboard with search, filters, per-model analytics
- Auto-clusters prompts by semantic similarity
- Prepares datasets for fine-tuning automatically
- Evaluation engine with LLM-as-judge

Result: identified that 62% of my calls didn't need
a premium model. Routing rules cut the bill to $73.

3 commands to run: git clone + cd + make start-full
```

```
MIT licensed. GitHub: [link]
```

Hora 2 — X Thread

```
Tweet 1:
I was mass paying $420/month to OpenAI.

Changed one line of code. Same app. Same quality.

New bill: $73.

Here's exactly what happened 

Tweet 2:
I put a gateway between my app and the API.

base_url = "localhost:8080" instead of "api.openai.com"

Every call now gets tracked automatically:
model, tokens, cost, latency, full prompt/response.

[screenshot do dashboard]

Tweet 3:
After one week, the data was brutal:

38% → simple formatting tasks ($2.50/M on GPT-4o)
24% → classification ($2.50/M on GPT-4o)
38% → actually needed GPT-4o

62% of my money was wasted.

[screenshot do cost breakdown]

Tweet 4:
The fix was simple routing rules:

- Formatting → DeepSeek ($0.14/M)
- Classification → Groq Llama 3.3 (~free, 10x faster)
- Complex reasoning → stays on GPT-4o

Same SDK. Same code. Just different model prefixes.

Tweet 5:
But the wildest part?

After 10k calls, a clustering algorithm automatically
found 5 distinct use cases in my traffic.

Each cluster = a clean dataset ready for fine-tuning.

I didn't configure this. It just happened.

[screenshot dos clusters]
```

```
Tweet 6:
The tool is called Lunar Router.

Open-source. MIT license. Self-hosted.
3 commands to run. 13 providers.

Your data never leaves your machine.

If you're spending >$100/month on LLM APIs:

github.com/lunar-org-ai/lunar-router

 if it saves you money.
```

Hora 3 — Product Hunt

Tagline: Cut your LLM API costs by 60-80%. Track every token. Prepare training data automatically.

Description: Short version of the Reddit post focusing on the $420 → $73 story.

Hora 4 — Dev.to Blog Post

Title: How I cut my LLM API costs from $420/mo to $73 with one line of code

Longer form version with screenshots, code snippets, and technical depth. Link to GitHub throughout.

Resto do Day 1 — X tweets individuais

Tweet 7:

```
Companies spent $8.4 billion on LLM APIs last year.

72% plan to spend MORE in 2026.

Most can't tell you which feature costs the most.

I built a free tool that shows you in 3 commands.
```

Tweet 8:

```
The pricing gap between LLM providers is now 1,000x.

$0.02/M tokens → $375/M tokens.

If you're not routing each prompt to the right tier,
you're lighting money on fire.
```

DAY 2 — RIDE THE WAVE

Reddit

- Reply to ALL new comments on Day 1 post

- Comment seed in 2-3 posts about LLM costs across r/LocalLLaMA, r/ChatGPTCoding

X (3 posts)

Tweet 1:

```
Day 1 results:

[X] GitHub stars (update with real number)
[X] Reddit comments answered
[X] Hacker News thread going

Thank you to everyone who tried it and reported bugs.

Open source is wild. [link]
```

Tweet 2:

```
Most asked question yesterday:

"What's the difference vs LiteLLM?"

LiteLLM: routes to 100+ models. Great proxy.

Lunar Router: proxy + cost dashboard + trace storage
+ semantic clustering + eval engine + distillation prep.

LiteLLM = pipe.
Lunar Router = cockpit.
```

Tweet 3:

```
Someone found a bug 4 hours after launch.
Fixed it in 20 minutes. Shipped the patch.

This is why open-source works.

Keep the issues coming: [link]
```

DAY 3

Reddit

Subreddit: r/selfhosted

Title: I self-hosted a one-command LLM dashboard and found I was burning $347/mo on prompts that didn't need a premium model

Body:

```
I wanted to know what my LLM app was actually doing
behind the scenes. How much each feature costs, which
models get used, what's wasting money.

Set this up:
```

```
git clone [repo]
cd lunar-router
make start-full

Changed my app's base_url to localhost:8080.
Opened localhost:3000.

First week of data:

- 14,200 calls tracked automatically
- Total spend: $347
- Calls that could've used a cheaper model: 8,700 (61%)
- Money wasted on wrong-tier models: ~$210

The dashboard shows everything in real time. Every call
with full prompt/response, searchable. I can type
"show me every call about refunds" and see every single
one with cost attached.

Stack: Go gateway + ClickHouse + React dashboard.
Runs on a $5/month VPS. One docker compose.

No accounts. No API keys to register. No telemetry.
Your data stays on your machine. MIT license.

[link]

Screenshots in comments.
```

X (3 posts)

Tweet 1:

```
"How much does each feature in my AI app cost?"

Before: "I think around $300?"
After: "Feature A costs $0.04/call. Feature B costs
$0.31/call. Feature C is $0.002/call and shouldn't
be on GPT-4o."

That precision changes everything.

[screenshot]
```

Tweet 2:

```
Debugging LLM responses without observability:

"The AI said something weird"
"Which call?"
"No idea"
"What was the prompt?"
"No idea"
"Which model?"
"No idea"
```

```
vs clicking one trace and seeing everything.

[screenshot of trace detail]
```

Tweet 3:

```
Self-hosted LLM dashboard.
$5/month VPS. One command.
Every API call tracked.

No SaaS. No vendor lock-in. No telemetry.

[screenshot]
```

DAY 4

Reddit (comment seeding)

- Monitor r/LocalLLaMA, r/ChatGPTCoding for posts about LLM costs, API pricing, model selection
- Add genuine value + natural mention

X (4 posts)

Tweet 1:

```
Switching from OpenAI to DeepSeek shouldn't require
rewriting your app.

model="openai/gpt-4o"          → $2.50/M
model="deepseek/deepseek-chat" → $0.14/M

Same SDK. Same line. 18x cheaper.

One word change. That's it.
```

Tweet 2:

```
Every LLM provider goes down sometimes.

If your app is hardcoded to one: your app goes down too.

Gateway + fallback routing:
Provider A fails → auto-retry on Provider B →
zero downtime for your users.

No code change needed.
```

Tweet 3:

```
Real LLM pricing right now (April 2026):

GPT-5.4:       $2.50/M input
Claude Sonnet:  $3.00/M input
Gemini Flash:   $0.30/M input
```

```
DeepSeek:       $0.14/M input

Are you routing each prompt to the right one?
Or paying premium for everything?
```

Tweet 4 (poll):

```
How much do you spend monthly on LLM APIs?

- Under $50
- $50-200
- $200-1000
- Over $1000
```

DAY 5

Reddit

Subreddit: r/ChatGPTCoding

Title: 62% of my GPT-4o calls were a waste of money. Took me one free tool and 5 minutes to find out.

Body:

```
I was paying ~$200/month on OpenAI APIs.
Assumed that was the cost of building with AI.

Installed an open-source gateway. 3 commands.
Changed one URL. Ran for a week.

The dashboard showed me:

- 62% of calls were simple tasks: extraction, formatting,
  classification. DeepSeek and Groq handle these identically.
- GPT-4o was being called 14,000+ times for things that
  don't need GPT-4o.
- My most expensive feature? A simple summarizer that ran
  800 times/day at $0.31/call. Switched to DeepSeek:
  $0.02/call. Same output.

Applied routing rules. No code changes in my app.
Bill: ~$200 → ~$68.

Setup:

git clone [repo]
cd lunar-router
make start-full

Point base_url to localhost:8080 instead of api.openai.com.

Every call tracked: cost, tokens, latency, full content.
Dashboard at localhost:3000.

MIT licensed. Data stays local. [link]
```

```
Genuinely curious: has anyone else done this kind of
audit on their API usage? What did you find?
```

X (3 posts)

Tweet 1:

```
My most expensive LLM feature was a summarizer.

800 calls/day. $0.31 each on GPT-4o. $248/month.

Switched to DeepSeek. $0.02/call. Same quality.

Went from $248/mo to $16/mo. On one feature.

I only found this because I tracked every call.
```

Tweet 2:

```
The first week of tracking your LLM calls
is always humbling.

"I thought I was spending wisely"

→ 62% wasted on wrong-tier models
→ Most expensive feature was a simple summarizer
→ Could've saved $150/mo from day one

Track first. Optimize second.
```

Tweet 3 (poll):

```
Do you know which feature in your AI app
costs the most to run?

- Yes, exactly
- Roughly
- No idea
- I have an AI app?
```

DAY 6

Reddit (comment seeding)

- r/LocalLLaMA, r/devops, r/artificial
- Find posts about observability, monitoring, API management
- Share real data points from the Lunar Router experience

X (3 posts)

Tweet 1:

```
Load balancing LLM calls in 5 lines:
```

```
router = lr.Router(
    model_list=[
        {"model_name": "smart", "model": "openai/gpt-4o"},
        {"model_name": "fast", "model": "groq/llama-3.3-70b"},
    ],
    strategy="least-cost"
)

round-robin, least-cost, lowest-latency, weighted-random.
All built-in.
```

Tweet 2:

```
Anthropic has different streaming format than OpenAI.
Bedrock has different auth.
Gemini has different tool calling syntax.

A good gateway translates all of these to one format.

Your app stays clean. The gateway handles the mess.
```

Tweet 3:

```
The $420 → $73 breakdown from my launch post:

Before:
- GPT-4o for everything: $420/mo

After:
- GPT-4o (complex only): $52/mo
- DeepSeek (extraction): $14/mo
- Groq (classification): $3/mo
- Other: $4/mo

Same app. Same quality. Different routing.
```

DAY 7

Reddit

Subreddit: r/LocalLLaMA

Title: I tracked 50k LLM calls and found out which models actually beat GPT-4o on my real prompts (not benchmarks)

Body:

```
Benchmarks told me GPT-4o was the best. My data said
something different.

After routing 50k production calls through 13 providers
and scoring every response:

Code generation (34% of my traffic):
- GPT-4o: quality 8.7/10, $4.20/1k calls
- DeepSeek: quality 8.2/10, $0.52/1k calls
```

```
- 94% of the quality at 12% of the cost.

Classification (22% of traffic):
- All models within 0.3 points of each other
- GPT-4o: $4.20/1k calls
- Groq Llama 3.3: $0.18/1k calls
- 23x price difference. Same results.

Content writing (19% of traffic):
- Claude actually beat GPT-4o here. 8.9 vs 8.5.
- But Claude costs more. Trade-off depends on volume.

Data extraction (18% of traffic):
- DeepSeek won. Faster, cheaper, slightly better
  at structured output.

Surprises:
- Latency varies 3x by time of day. Groq at 2am
  is a beast. Groq at 2pm EST crawls.
- The cheapest model was often the fastest.
- Semantic routing (auto-picking per prompt) saved 67%.

All measured with LLM-as-judge + similarity metrics.
Not vibes. Data.

The tool that collected and evaluated all this
is open-source (MIT): [link]

Your results will be different. That's the whole point.
Test on YOUR data, not synthetic benchmarks.
```

X (3 posts — thread)

```
Tweet 1:
I tracked 50k LLM calls across 13 providers.

Benchmarks said GPT-4o wins everything.
My production data said otherwise.

Real numbers 

Tweet 2:
Code generation (34% of my traffic):

GPT-4o: 8.7/10 quality — $4.20/1k calls
DeepSeek: 8.2/10 quality — $0.52/1k calls

94% of the quality. 12% of the cost.

For 34% of my traffic, I was overpaying 8x.

Tweet 3:
Classification (22% of traffic):

All 3 models within 0.3 points.
```

```
GPT-4o: $4.20/1k calls
Groq: $0.18/1k calls

Same results. 23x price difference.

This is the most wasted money in most LLM apps.

Tweet 4:
Biggest surprise: Claude beat GPT-4o on content writing.

8.9 vs 8.5 quality score.

Benchmarks never showed this. Production data did.

Tweet 5:
"But benchmarks say—"

Benchmarks test generic tasks.
Your app has specific tasks.

The only benchmark that matters is YOUR data.

Tool is open-source. Run your own evals: [link]
```

DAY 8

Reddit (comment seeding)

- Go back to ALL previous posts, reply to new comments
- Seed 2-3 posts in r/MachineLearning, r/ChatGPTCoding about model comparison
- Share data points: "I ran this comparison on real data and found..."

X (3 posts)

Tweet 1:

```
Week 1 recap:

 [number] GitHub stars
 [number] bugs found by community
 [number] PRs merged
 [number] Reddit comments answered

The open-source community built more in 7 days
than I expected in a month.

[link]
```

Tweet 2:

```
Someone asked: "Why not just check my OpenAI dashboard?"

Because:
- It only shows OpenAI (you use 3+ providers)
- No per-feature breakdown
```

```
- Can't search prompt content
- Can't compare across providers
- Can't export for fine-tuning

That's like checking one credit card
when you have five.
```

Tweet 3:

```
Things I learned tracking 50k LLM calls:

1. Morning calls are 2x faster (US timezone)
2. 70% of "complex" prompts don't need a complex model
3. The cheapest model is often the fastest
4. Cost per feature varies 50x within the same app

Your app probably has similar patterns.
You just can't see them yet.
```

DAY 9

Reddit

Subreddit: r/devops

Title: Added LLM observability to our stack with one line change. Found $200/mo in wasted API calls in the first week.

Body:

```
We're running LLMs in production. Had zero visibility.
No cost-per-feature data. No way to debug bad responses.
No latency tracking per provider.

Added a gateway proxy. Literally one line:

base_url = "http://localhost:8080/v1"

Everything else stays the same. Same SDK, same code.

What we found in week 1:

- $200/mo going to GPT-4o for calls that don't need it
- One feature making 800 calls/day at $0.31 each ($248/mo)
  that runs identically on a $0.02/call model
- 3 features calling the API with nearly identical prompts
  (consolidation opportunity)
- P95 latency spikes correlating with specific providers
  at specific times

The stack:
- Go gateway (port 8080) — sub-millisecond overhead
- ClickHouse — trace storage, analytical queries
- React dashboard (port 3000) — filterable trace explorer
- Python API (port 8000) — analytics, clustering, evals
```

```
One command: make start-full
Runs on a $5 VPS for moderate traffic.
We do ~50k calls/day on a $20 instance.

MIT licensed, self-hosted: [link]

What is everyone else using for LLM observability?
Curious how teams are solving this.
```

X (3 posts)

Tweet 1:

```
LLM observability stack in one command:

make start-full

Go gateway + ClickHouse + React dashboard.

Every API call tracked automatically.
$5 VPS. Open-source. MIT.

We found $200/mo in waste the first week.
```

Tweet 2:

```
One feature in our app was making 800 LLM calls/day.

$0.31 each on GPT-4o.
$248/month. On one feature.

Switched to DeepSeek: $0.02/call.
$16/month. Same output.

We only found this because we tracked every call.

How many features like this are hiding in your app?
```

Tweet 3 (poll):

```
How do you currently track your LLM API costs?

- Custom logging
- Provider dashboard
- I don't
- "We should probably do that"
```

DAY 10

Reddit (engagement)

- Reply to all posts from Week 1
- Post update comment on Day 1 launch post with star count, bugs fixed, features added

X (4 posts)

Tweet 1:

```
10 days in. Some real numbers:

Stars: [number]
Issues opened: [number]
Issues closed: [number]
PRs from community: [number]
Countries: [number]

Building in public is the best marketing.

[link]
```

Tweet 2:

```
Top 3 feature requests from the community:

1. [feature]
2. [feature]
3. [feature]

Working on #1 right now. PR welcome for #2 and #3.

This is why open-source wins.
```

Tweet 3:

```
Hot take: if you're spending >$100/mo on LLM APIs
and can't answer "which feature costs the most" —

you have a visibility problem, not a cost problem.

Fix visibility first. Cost fixes itself.
```

Tweet 4:

```
Quick update: shipped [feature/fix] based on
community feedback.

Opened an issue Monday → PR Tuesday → merged Wednesday.

Open-source speed > enterprise speed.

[link to PR]
```

DAY 11

Reddit

Subreddit: r/LocalLLaMA

Title: Switched my app's base_url from api.openai.com to localhost — here's exactly what I see now for every call

Body:

```
People keep asking what the dashboard actually shows.
Here's a full walkthrough.

The change:
base_url = "http://localhost:8080/v1"

That's it. Same OpenAI SDK. Same code.

What I see now for EVERY call:

1. Model used (openai/gpt-4o, deepseek/deepseek-chat, etc)
2. Tokens: input count, output count
3. Cost: exact dollar amount ($0.0043 for this call)
4. Latency: total ms, time to first token
5. Full prompt: every word I sent
6. Full response: every word the model returned
7. Timestamp, session ID, metadata

All of this searchable. I can type "refund" and see
every single call where a user mentioned refunds.
With the model's response. With the cost.

Filter by:
- Model (show me only DeepSeek calls)
- Date range (last 24 hours)
- Cost range (calls over $0.10)
- Latency (calls over 3 seconds)

Click any trace → full detail drawer.

And the feature nobody talks about: it auto-clusters
prompts by semantic similarity. So after a few thousand
calls, I can see "35% of traffic is code generation,
22% is classification, 18% is extraction" — without
configuring anything.

13 providers. MIT. Self-hosted. 3 commands.

[link]

[Screenshots in comments]
```

X (3 posts)

Tweet 1:

```
What I see for every LLM call now:

- Model used
- Tokens in/out
- Cost to the cent
- Full prompt + response
- Latency breakdown
```

```
All searchable. "Show me every call about refunds" → done.

One line change to get this.

[screenshot]
```

Tweet 2:

```
I didn't know 35% of my LLM traffic was code generation
until a clustering algorithm told me.

It analyzed 10k calls, grouped them by semantic similarity,
and labeled each cluster automatically.

No configuration. No manual tagging. Just data in → insights out.

[screenshot of clusters]
```

Tweet 3:

```
Your app has patterns you don't know about.

Mine had 5 distinct use cases I never designed for.
Users found them naturally.

I only discovered this by tracking every single call
and letting clustering find the patterns.

What would YOUR data show?
```

DAY 12

Reddit (comment seeding)

- r/ChatGPTCoding, r/artificial
- Find posts about "which model should I use", "cheapest API", "reduce AI costs"
- Lead with data, mention tool naturally at the end

X (3 posts)

Tweet 1:

```
"But I only use one provider, I don't need a gateway"

You also don't need to:
- Know your cost per feature
- Debug bad responses
- See latency patterns
- Have fallback when OpenAI goes down
- Prepare training data

...until you do. And then it's too late to start.
```

Tweet 2:

```
Providers supported:

OpenAI ✓
Anthropic ✓ (SSE translated automatically)
Gemini ✓
Mistral ✓
Groq ✓
DeepSeek ✓
Perplexity ✓
Cerebras ✓
SambaNova ✓
Together ✓
Fireworks ✓
Cohere ✓
AWS Bedrock ✓ (auth handled)

One API format. One SDK. One dashboard.
```

Tweet 3 (poll):

```
If you could cut your LLM API costs by 60%
with zero code changes — would you?

- Obviously yes
- Too good to be true
- Already did it
- Show me the data
```

DAY 13

Reddit

Subreddit: r/artificial

Title: Companies spent $8.4B on LLM APIs last year. I found that most can't even tell you where the money goes.

Body:

```
Some stats:

- LLM API spending: $500M → $8.4B in 18 months
- 72% of orgs expect higher spending in 2026
- Nearly 40% spend over $250K/year on LLMs
- Price gap between cheapest and most expensive model: 1,000x

And yet when I ask teams "which feature costs the most?" —
blank stares.

I've been running an open-source gateway that tracks every
LLM call automatically. The pattern is always the same:

- 40-60% of calls don't need a premium model
- The most expensive feature is usually a surprise
- Simple routing rules cut the bill in half
```

```
One team found a summarizer running 800x/day on GPT-4o
at $0.31/call ($248/mo). Same quality on DeepSeek at
$0.02/call ($16/mo). $232/mo saved on ONE feature.

3 commands to set up. MIT licensed. Self-hosted.

[link]

Is anyone here tracking LLM costs systematically?
What tools are you using?
```

X (3 posts)

Tweet 1:

```
$8.4 billion spent on LLM APIs last year.

72% of companies plan to spend MORE.

Most can't tell you which feature costs the most.

The problem isn't the spending.
It's the blindness.
```

Tweet 2:

```
One team found a single feature burning $248/mo.

800 calls/day × $0.31/call on GPT-4o.

Same quality on DeepSeek: $16/mo.

$232/mo saved. One feature. One routing rule.

Multiply that by every feature in your app.
```

Tweet 3:

```
40% of companies spend over $250K/year on LLMs.

Most can't answer:
- Cost per feature?
- Which calls need premium?
- What % is wasted?

Step 1: track everything.
Step 2: optimize with data.
Step 3: save 60-80%.
```

DAY 14

Reddit (engagement day)

- Update comment on Day 1 post: 2-week results

- Reply to all unanswered comments across all posts
- Share star count milestone

X (4 posts)

Tweet 1:

```
2 weeks of Lunar Router:

 [number] stars
 [number] countries
 [number] bugs fixed
 [number] features shipped

Most valuable: every single issue and PR
came from real users with real problems.

[link]
```

Tweet 2:

```
Week 2 learnings:

- Posts with real $ numbers get 3x engagement
- Dashboard screenshots > text descriptions
- Reddit cares about honesty > marketing
- Devs ask "setup time?" before "features?"

Adjusting content accordingly.
```

Tweet 3:

```
Someone DMed: "I set up Lunar Router and found
$180/mo in waste in the first 3 days"

This is why I build in public.

Stories like this matter more than star counts.
```

Tweet 4 (poll):

```
What's stopping you from tracking your LLM costs?

- Don't know how
- Too much setup effort
- Not worth it for my scale
- Already tracking everything
```

DAY 15

Reddit

Subreddit: r/LocalLLaMA

Title: After 10k API calls, a clustering algorithm found 5 use cases in my traffic I didn't know existed — each one is now a fine-tuning dataset

Body:

```
This was not planned. I set up Lunar Router to track
costs. But it also clusters your prompts by semantic
similarity automatically.

After ~10k calls, it grouped my traffic into 5 clusters:

- Code generation (34%) — 3,400 prompt-response pairs
- Data extraction (28%) — 2,800 pairs
- Content writing (19%) — 1,900 pairs
- Classification (12%) — 1,200 pairs
- Other (7%) — 700 pairs

Each cluster is a clean dataset of input/output pairs.
My actual users, my actual tasks, my actual quality bar.

The quality gates helped:
- Coherence scoring removed 2 garbage clusters
- Outlier detection removed ~400 bad examples
- AI agent labeled each cluster automatically
  ("Code Generation", "Data Extraction", etc)

I took the largest cluster (code generation, 3,400 pairs)
and fine-tuned a 7B model with LoRA.

Result: handles that use case at comparable quality
to GPT-4o. Cost: 1/50th.

Research says 100-500 quality examples is often enough
for straightforward tasks. Production traffic gives you
thousands — pre-filtered, domain-specific, real pairs.

The whole pipeline is open-source (MIT): [link]

Anyone else doing production-to-fine-tuning pipelines?
Would love to compare approaches.
```

X (3 posts)

Tweet 1:

```
Every prompt you send to OpenAI is a fine-tuning example
you're paying for and throwing away.

After 10k calls through my gateway:

- 5 use cases found automatically
- 3,400 clean training pairs in one cluster
- Fine-tuned a 7B model
- Handles 80% of that traffic at 1/50th the cost

Your production data IS your training data.
```

Tweet 2:

```
What most LLM apps do:

User → API → Response → Gone

What they should do:

User → Gateway → Response + trace stored
→ Clustered by use case → Clean dataset
→ Fine-tune your own model

One setup. Fully automatic.
```

Tweet 3:

```
"But I don't have enough data to fine-tune"

100 LLM calls/day = 1,400 in 2 weeks.

Clustered and filtered = 200-500 quality pairs per use case.

That's MORE than enough for LoRA.

You have the data. You're just not capturing it.
```

DAY 16

Reddit (comment seeding)

- r/LocalLLaMA, r/MachineLearning
- Find posts about fine-tuning, distillation, LoRA, training data
- Share the clustering pipeline approach

X (3 posts)

Tweet 1:

```
The clustering blew my mind.

I didn't tell it my app has 5 use cases.
It found them by analyzing prompt embeddings.

Code generation: 34%
Data extraction: 28%
Content writing: 19%
Classification: 12%
Other: 7%

Each one = a clean dataset. No manual labeling.

[screenshot]
```

Tweet 2:

```
Model distillation from production data:

Step 1: Route calls through gateway (auto-captures everything)
Step 2: Clustering groups prompts by similarity
Step 3: Quality gates filter garbage
Step 4: Export clean pairs
Step 5: LoRA fine-tune a 7B model

Result: 5-30x cheaper inference.

All open-source.
```

Tweet 3 (poll):

```
Would you fine-tune your own model if the data
was already organized for you?

- 100%, show me how
- Maybe, depends on effort
- No, I'll keep paying OpenAI
- Already doing this
```

DAY 17

Reddit

Subreddit: r/MachineLearning

Title: I fine-tuned a 7B model on production data my gateway captured automatically. It now handles 80% of traffic at 1/50th the cost.

Body:

```
Sharing a pipeline that turns production LLM traffic
into fine-tuning datasets automatically.

The problem: we call GPT-4o for everything, pay premium,
and discard the most valuable training data we'll ever
have — our own users' real-world inputs and outputs.

The pipeline:

1. Go gateway captures every API call with full I/O
2. MiniLM embeddings encode each prompt
3. KMeans clusters by semantic similarity
4. LLM agent auto-labels each cluster
5. Quality gates: coherence scoring, outlier detection
6. Clean input/output pairs exported per cluster

Results from 50k captured calls:
- 5 distinct clusters identified automatically
- ~8k high-quality pairs after filtering
- Fine-tuned Llama 7B with LoRA on the largest cluster
- Task-specific quality matched GPT-4o
- Inference cost: 1/50th
```

```
The research backs this: 100-500 quality examples
with LoRA is enough for straightforward tasks.
TensorZero reports 5-30x cheaper inference with
distilled models. Our numbers are consistent.

The full pipeline is open-source (MIT): [link]

The endgame: Year 1 you pay full price. Year 2 your
own model handles 80% of traffic. The cost curve
only goes down.
```

X (3 posts — thread)

```
Tweet 1:
The endgame for LLM apps:

Year 1: pay $X/month for GPT-4o
Year 1.5: capture + cluster all traffic
Year 2: fine-tune your own model
Year 2+: 80% of traffic at 1/50th the cost

I'm at Year 2. Here's how 

Tweet 2:
Step 1: every API call goes through a gateway.

Full input/output stored. Cost tracked.
Latency logged. Nothing lost.

This is the data pipeline most teams are missing.

Tweet 3:
Step 2: semantic clustering groups your traffic
by use case. Automatically.

After 10k calls → 5 clean datasets.
No manual labeling. No configuration.

Tweet 4:
Step 3: quality gates filter the garbage.

Coherence scoring. Outlier detection.
AI labels each cluster.

From 10k raw pairs → 8k clean training examples.

Tweet 5:
Step 4: LoRA fine-tune a 7B model on your
largest cluster.

100-500 examples is enough for simple tasks.
You'll have thousands.

Result: matches GPT-4o quality for that specific task.
```

```
At 1/50th the cost.

Tweet 6:
The full pipeline is open-source. MIT license.

Gateway + clustering + quality gates + dataset export.

Start capturing now. Your future fine-tuned model
will thank you.

[link]
```

DAY 18

Reddit (comment seeding)

- r/LocalLLaMA, r/ChatGPTCoding
- Find posts about evaluation, model quality, LLM testing
- Share evaluation engine capabilities with data

X (3 posts)

Tweet 1:

```
"Is DeepSeek as good as GPT-4o for my use case?"

Don't guess. Measure.

Run your actual prompts through both.
Score with LLM-as-judge.
See the numbers.

For my code gen tasks: 8.2 vs 8.7 quality.
94% as good. 12% of the cost.

Your numbers will be different. That's the point.
```

Tweet 2:

```
Built-in evaluation metrics:

- Exact match
- Contains check
- Similarity scoring
- LLM-as-judge
- Latency comparison
- Cost comparison

Run them across any models. Side-by-side results.

Stop trusting benchmarks. Trust YOUR data.
```

Tweet 3:

```
7 AI agents built into Lunar Router:

- Cluster labeler (names your prompt groups)
- Coherence scorer (rates dataset quality)
- Outlier detector (removes bad examples)
- Merge checker (finds duplicate clusters)
- Trace scanner (finds hallucinations)
- Eval generator (creates test suites)
- Metrics suggester (domain-specific evals)

All configurable. All open-source.
```

DAY 19

Reddit

Subreddit: r/ChatGPTCoding

Title: I compared GPT-4o, DeepSeek, and Groq on 15k real production prompts. Benchmarks were wrong about my use case.

Body:

```
Instead of trusting public benchmarks, I ran my own
evaluation on real prompts from my app.

Captured 2 weeks of traffic (~15k calls).
Clustered by use case. Ran each cluster
through 3 models. Scored with LLM-as-judge.

Code generation (34% of traffic):
- GPT-4o: 8.7/10 quality — $4.20/1k calls
- DeepSeek: 8.2/10 — $0.52/1k calls
- Groq: 7.8/10 — $0.18/1k calls

Classification (22%):
- All within 0.3 points of each other
- GPT-4o: $4.20/1k calls
- Groq: $0.18/1k calls
- 23x price difference. Same results.

Content writing (19%):
- Claude beat GPT-4o: 8.9 vs 8.5
- Benchmarks never showed this

Extraction (18%):
- DeepSeek won. Faster + cheaper +
  slightly better at structured output.

Biggest surprise: for classification tasks,
paying for GPT-4o is pure waste. Groq is 23x
cheaper with identical quality.

The eval tool is open-source: [link]
```

```
Your results WILL be different. That's the point.
Generic benchmarks don't tell you what works
for YOUR prompts. Run your own evals.
```

X (3 posts)

Tweet 1:

```
Benchmarks said GPT-4o wins at classification.

My production data: all 3 models within 0.3 points.

GPT-4o: $4.20/1k calls
Groq: $0.18/1k calls

Same quality. 23x price difference.

Benchmarks are generic. Your data isn't.
```

Tweet 2:

```
Claude beat GPT-4o on content writing in my evals.

8.9 vs 8.5 quality score on real production prompts.

No public benchmark showed this.

The only reliable benchmark is YOUR data
through YOUR prompts.
```

Tweet 3:

```
Stop choosing models based on leaderboards.

MMLU doesn't know your use case.
HumanEval doesn't know your prompts.
Arena ratings don't know your quality bar.

Capture your traffic → run evals → trust YOUR data.

Here's a free tool to do it: [link]
```

DAY 20

Reddit (recap + update)

Comment on Day 1 post:

```
20-day update:

 [number] GitHub stars
 [number] issues resolved
 [number] features shipped from community requests
 Users in [number] countries
```

```
 Reported savings from users: $[total]

Top features people love:
1. One-line setup (base_url change)
2. Cost-per-feature visibility
3. Automatic prompt clustering

Coming next: [roadmap items]

Thank you to everyone who starred, tried it,
broke it, and fixed it. This community is insane.

If you haven't tried it yet:
git clone + make start-full. 5 minutes.

[link]
```

Comment seed in 2-3 relevant posts across target subs

X (4 posts)

Tweet 1:

```
20 days building Lunar Router in public.

Stars: [number]
Contributors: [number]
Most-saved tweet: [which one]
Biggest learning: people share results, not features.

"I cut my costs by X" gets 10x more shares
than "13 providers supported."

Thank you all.
```

Tweet 2:

```
The full Lunar Router stack:

Your App
  ↓
Go Gateway (:8080) — routes 13 providers
  ↓
ClickHouse — stores every trace
  ↓
Python API (:8000) — clustering, evals, agents
  ↓
React Dashboard (:3000) — see everything

One command: make start-full

From $420/mo to $73/mo.
MIT licensed. [link]
```

Tweet 3:

```
What we shipped in 20 days based on YOUR feedback:

- [feature 1]
- [feature 2]
- [feature 3]

Open-source means users build the product.

What should we ship next?
```

Tweet 4 (poll):

```
What should we focus on next?

- More providers
- Better dashboard
- Fine-tuning integration
- MCP / Claude Code plugin
```

POSTING SCHEDULE

Day	Reddit	X	Focus
Pre	Prep + 200 stars	Setup account	Foundation
1	r/LocalLLaMA + HN + PH	8 tweets (thread)	BLITZ LAUNCH
2	Comment replies + seeding	3 tweets	Ride the wave
3	r/selfhosted	3 tweets	Dashboard/visibility
4	Comment seeding	4 tweets (1 poll)	Provider switching
5	r/ChatGPTCoding	3 tweets (1 poll)	Cost waste discovery
6	Comment seeding	3 tweets	Technical features
7	r/LocalLLaMA	3 tweets (thread)	Real benchmarks
8	Comment seeding + replies	3 tweets	Week 1 recap
9	r/devops	3 tweets (1 poll)	Observability
10	Engagement day	4 tweets	Community building
11	r/LocalLLaMA	3 tweets	Full dashboard tour
12	Comment seeding	3 tweets (1 poll)	Provider diversity
13	r/artificial	3 tweets	Market data/$8.4B
14	Engagement day	4 tweets (1 poll)	Week 2 recap
15	r/LocalLLaMA	3 tweets	Clustering/distillation
16	Comment seeding	3 tweets (1 poll)	Fine-tuning data
17	r/MachineLearning	3 tweets (thread)	Full pipeline

19	r/ChatGPTCoding	3 tweets	Model comparison
20	Recap + update	4 tweets (1 poll)	Celebration

Totals:

- Reddit: 10 posts + HN + Product Hunt + Dev.to + comment seeding
- X: 65 tweets (3 threads, 7 polls)
- All hooks lead with RESULTS, not features

HOOK RULES (NEVER BREAK THESE)

1. Every title must contain a RESULT ("cut costs by X", "found $X in waste", "fine-tuned and saved X")
2. Never lead with what the tool IS. Lead with what the tool DID.
3. Numbers are mandatory. Vague = invisible. "$420 → $73" beats "reduced costs significantly."
4. The product name should NOT be in the Reddit title. Lead with the story.
5. If someone can't understand the value in 3 seconds of reading the title, rewrite it.
6. Screenshots get 3x engagement. Always include visuals.
7. Reply to EVERY comment in the first 3 hours on Reddit. This is non-negotiable.

PLATFORMS BEYOND REDDIT + X (Day 1 Blitz)

Platform	When	Expected Stars
Reddit r/LocalLLaMA	Hour 0	200-500
Hacker News Show HN	Hour 1	500-2000
X Thread	Hour 2	50-200
Product Hunt	Hour 3	200-600
Dev.to Blog Post	Hour 4	50-100
Awesome Lists (submit)	Day 3+	Slow but permanent

All within 48 hours to trigger GitHub Trending algorithm. Trending = hundreds of organic stars per day = snowball.
